

► News in product portfolio

We have successfully expanded the range of our products with 2 new products!

First of them is a **combined probe** which, in addition to the height of the water level, also measures its temperature and conductivity. It is especially suitable for monitoring water resources, especially in mineral wells.

Another newly offered product is the **PA 445 display**. More precisely, it is a display unit for a current loop with switching outputs. It is available in variants with 1 or 2 relays.

This display was also used in the Dešťovka set, based on the success of this, it was now included in our permanent offer separately.
